

Aula 08 – Detecção e reconhecimento de objetos

Prof. João Fernando Mari

joaofmari.github.io

joaof.mari@ufv.br

- Localização, detecção e segmentação
- Família R-CNN
 - R-CNN
 - Fast R-CNN
 - Faster R-CNN
- Família YOLO

Localização, detecção e segmentação

Semantic Segmentation

GRASS, CAT,
TREE, SKY

No objects, just pixels

Classification + Localization

CAT

Single Object

Object Detection

DOG, DOG, CAT

Multiple Object

Instance Segmentation

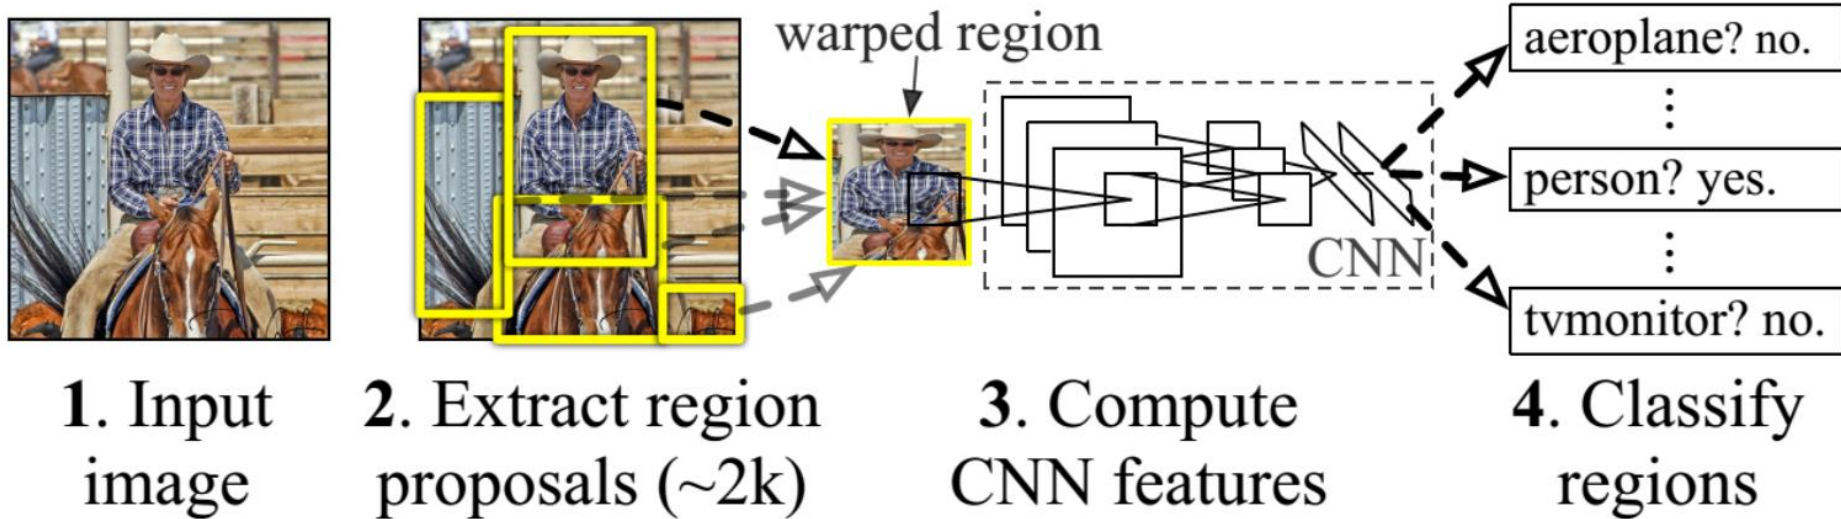

DOG, DOG, CAT

This image is CC0 public domain

R-CNN

R-CNN: *Regions with CNN features*

Ross Girshick, et al. "Rich feature hierarchies for accurate object detection and semantic segmentation.", 2014.

R-CNN

Ross Girshick. Fast R-CNN. Facebook AI Research (FAIR).

- **R-CNN – Region-based Convolutional Neural Network**
- Varre a imagem buscando possíveis objetos
 - Selective Search
 - Gera ~2000 propostas de regiões
- Passa as propostas de regiões por uma CNN
 - Antes, redimensiona as regiões para o tamanho da camada de entrada da CNN.
- Baseado na saída da CNN:
 - Classifica a região com um classificador SVM
 - Aplica regressão linear para localizar o *bounding-box* do objeto.

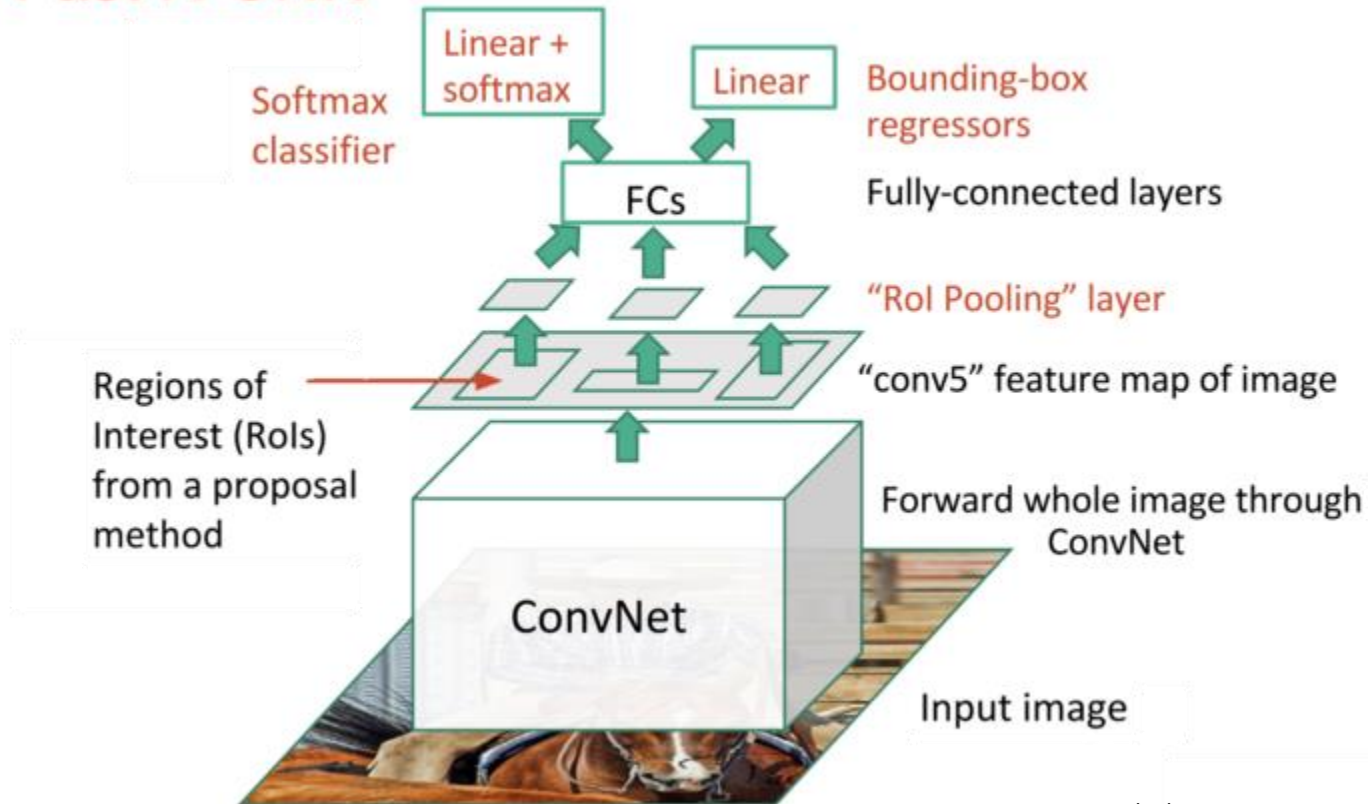

FAST R-CNN

Fast R-CNN

Ross Girshick. "Fast R-CNN.", 2015.

Fast R-CNN

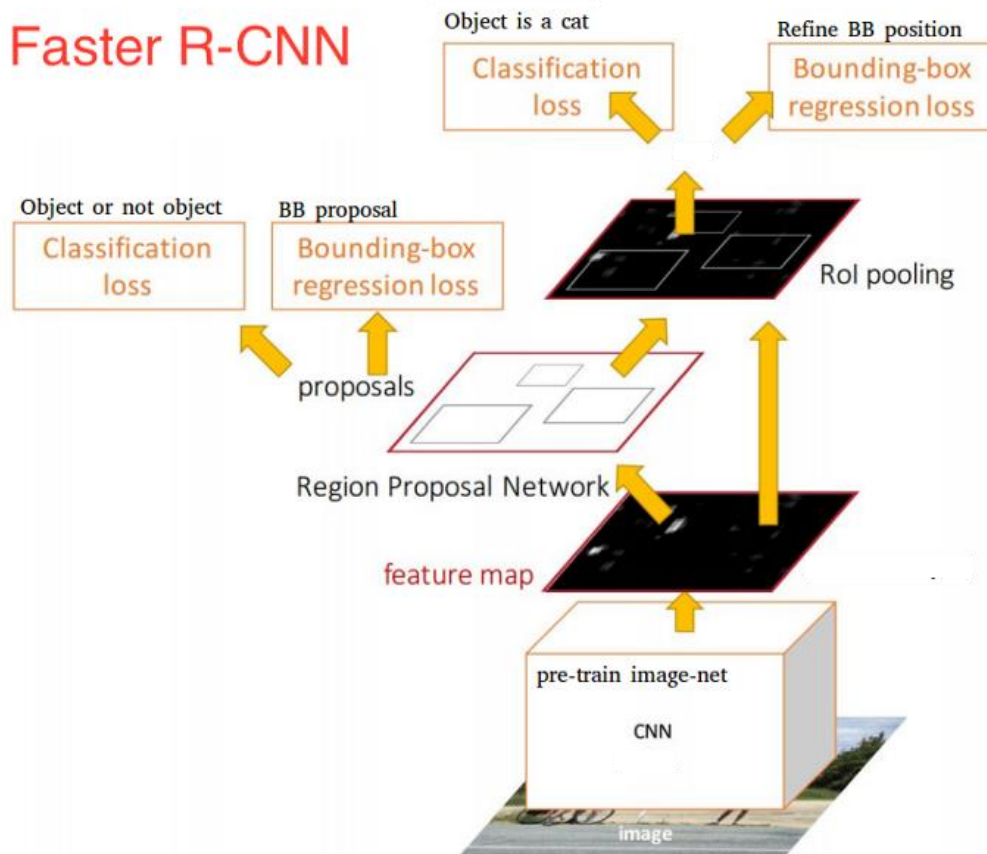

Ross Girshick. Fast R-CNN. Facebook AI Research (FAIR).

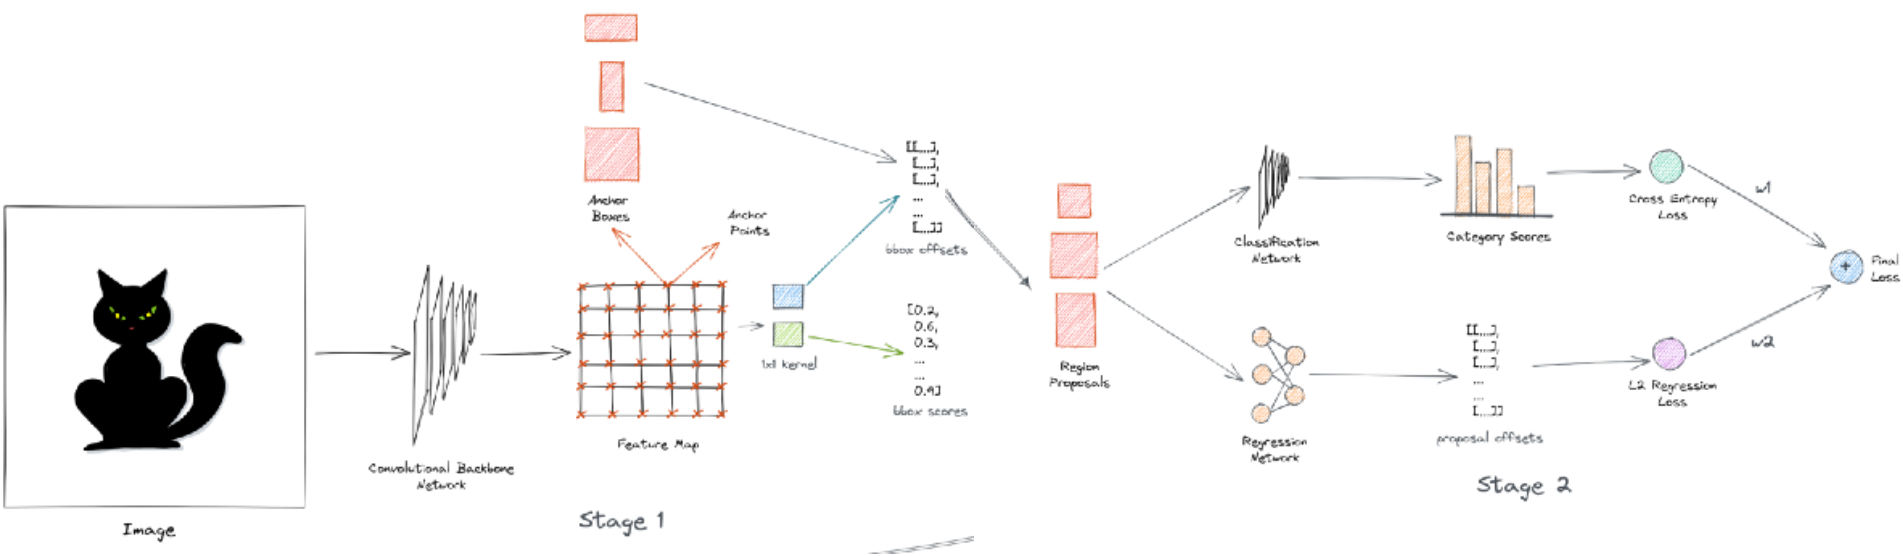

- A imagem de entrada passa por uma CNN
 - Um modelo pré-treinado da VGG-16 é usado para extração de características.
- No final da CNN é incluída uma camada chamada de Region of Interest Pooling Layer (RoI Pooling)
 - Rols obtidas a partir da imagem de entrada
- A saída da CNN é interpretada por uma camada completamente conectada.
- Na sequencia, o modelo bifurca em duas saídas:
 - Uma para a predição de classe via camada softmax
 - Outra com uma saída linear para o bounding-box.
- O processo é repetido múltiplas vezes para cada região de interesse em uma imagem.

FASTER R-CNN

Faster R-CNN

Ren, et al. "Faster R-CNN: Towards Real-Time Object Detection with Region Proposal Networks.", 2016.

<https://towardsdatascience.com/understanding-and-implementing-faster-r-cnn-a-step-by-step-guide-11acff216b0>

- **Etapla 1: Rede de propostas de regiões (*region proposal network*)**
 - A imagem toda passa por uma CNN pré-treinada (ResNet, VGG-16, ...)
 - A saída é um mapa de características
 - Cada ponto do mapa de características é tratado como uma âncora.
 - Para cada âncora, são geradas múltiplas caixas com tamanhos diferentes
 - Uma CNN com kernels 1x1 é usada para predizer a categoria e offset das caixas
 - Comparando as caixas com o *ground-truth* (durante o treinamento)
 - » Discriminadas caixas positivas (objetos) e negativas (fundo)
 - » Entropia cruzada binária com função de perda
 - Uma CNN com kernel 1x1 aprende os *bounding-boxes* dos objetos
 - » Regressão com função de perda L2 (distância Euclidiana)
 - As caixas são transformadas de acordo com os *bounding-boxes*
 - Propostas de região.

- **Etapas 2:**
 - Uma CNN simples classifica as propostas de região em múltiplas classes
 - Entropia cruzada
 - *RoI pooling* é usado para redimensionar as propostas de região para o tamanho da entrada de rede.
 - Outra rede usa regressão para alinhar os *bounding-boxes*
 - Função de perda L2
 - A função de perda final combina entropia cruzada com L2

YOLO

- **YOLO - You Only Look Once**

- YOLO (2015)
- YOLOv2 (2017)
- YOLOv3 (2018)
- YOLOv4 (2020)
- YOLOv5 (2020)
- YOLOv6 (2022)
- YOLOv7 (2022)
- ...

- Etapa 1: Blocos residuais
 - Dividir a imagem em pequenas caixas organizadas em grade

<https://www.exactcorp.com/blog/Deep-Learning/YOLOv5-PyTorch-Tutorial>

- Etapa 2: Regressão do bounding-box
 - Identifica os objetos dentro de um bounding-box
 - Após detectar um objeto, desenha um bounding-box ao seu redor
 - center point, height, width, and class

<https://www.exactcorp.com/blog/Deep-Learning/YOLOv5-PyTorch-Tutorial>

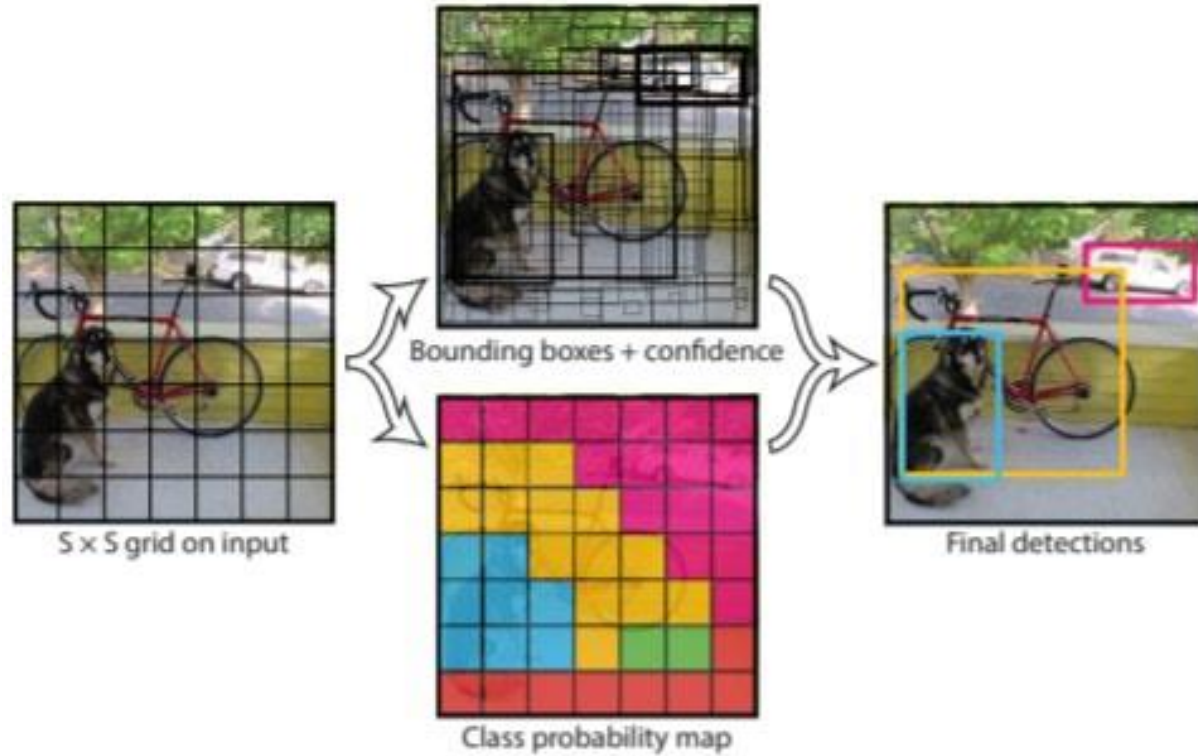

- Etapa 3: Intersecção sobre União (IoU – *Intersection over Union*)
 - Usado para calcular a acurácia do modelo

<https://www.exxactcorp.com/blog/Deep-Learning/YOLOv5-PyTorch-Tutorial/>
